

Effect of Amla fruit (*Emblica officinalis* Gaertn.) on blood glucose and lipid profile of normal subjects and type 2 diabetic patients.

The present study evaluated the anti-hyperglycemic and lipid-lowering properties of *Emblica officinalis* Gaertn. fruit in normal and diabetic human volunteers. The results indicated a significant decrease ($P < 0.05$) in fasting and 2-h post-prandial blood glucose levels on the 21st day in both normal and diabetic subjects receiving 1, 2 or 3 g *E. officinalis* powder per day as compared with their baseline values. Significant ($P < 0.05$) decreases were also observed in total cholesterol and triglycerides in both normal and diabetic volunteers on day 21 that were given either 2 or 3 g *E. officinalis* powder per day. However, diabetic volunteers receiving only 3 g *E. officinalis* powder exhibited a significant ($P < 0.05$) decrease in total lipids on day 21. Both normal and diabetic volunteers receiving 2 or 3 g *E. officinalis* powder significantly ($P < 0.05$) improved high-density lipoprotein-cholesterol and lowered low-density lipoprotein-cholesterol levels.
