

Effect of wheat gluten hydrolysate on the immune system in healthy human subjects.

Nine healthy volunteers were divided into a test group ($n = 5$) and a control group ($n = 4$). The test group consumed 3 grams per d of wheat gluten hydrolysate for 6 d, and their NK cell activity and hematological parameters were measured: The same assessments were performed in the control group, which did not receive wheat gluten hydrolysate. In the test group, NK cell activity increased significantly ($P = 0.018$) after wheat gluten hydrolysate intake. No adverse effects were observed in either group.
