

Methionine as methyl-group donor in the synthesis of *Mycobacterium avium* envelope lipids, and its inhibition by DL-ethionine, D-norleucine and DL-n...

The radioactivity from 3H-methyl methionine was rapidly incorporated into the surface lipids of *Mycobacterium avium*. The transmethylation reaction was efficiently inhibited by DL-ethionine, D-norleucine and DL-norleucine. The structure of the outerlayer of the *M. avium* envelope was profoundly altered in the bacteria treated with DL-norleucine.
