

First record of human infection with the tapeworm *Diphyllobothrium nihonkaiense* in North America.

The tapeworm *Diphyllobothrium nihonkaiense* (Cestoda: Diphyllbothriidea), originally described from Japan, is reported from a man in North America for the first time. Species identification was based on sequences of ribosomal (partial 18S rRNA) and mitochondrial (partial Cytochrome c Oxidase subunit I) genes of proglottids expelled from a Czech tourist who ate raw Pacific sockeye salmon (*Oncorhynchus nerka*) from British Columbia, Canada.
