

Neurocysticercosis in pregnancy: not just another headache.

Infection with pork tapeworm, or *Taenia solium*, affects approximately 50 million people worldwide. The most important and potentially devastating form of the infestation, neurocysticercosis, occurs when the parasite invades the central nervous system. There has been a significant increase in the number of cases in the United States due to immigration from endemic areas. This case study of a pregnant woman in the 35th week of gestation exemplifies the serious consequences of this infection in pregnancy, and discusses an evidence-based approach to the diagnosis, treatment and eradication of this preventable disease. © 2012 AWHONN.
