

## ***Piglets Are a Source of Pathogenic Yersinia enterocolitica on Fattening-Pig Farms***

. . . . .

To study the origin and spread of *Yersinia enterocolitica* among pigs, fecal and blood samples were repeatedly taken on a fattening farm. A few piglets were found to be already infected on breeding farms. After the piglets were mixed, the infection spread through the whole unit. Eventually, all the pigs excreted the pathogen.
