

Trial of garlic as an adjunct therapy for multidrug resistant *Pseudomonas aeruginosa* pneumonia in a critically ill infant.

We present a case of a critically ill infant with severe multidrug-resistant *Pseudomonas aeruginosa* pneumonia and bacteremia who was treated with garlic and antibiotics after in vitro demonstration of a change in the resistance pattern via the disc diffusion method on garlic-treated Mueller Hinton agar. To our knowledge, this is the first report of therapeutic garlic use in a critically ill infant in the literature.
